Functions (Cont.)

Example:

```
1  #!/bin/sh
2
3  test_fun1(){
4      var=FUN_VAR
5      shift
6      echo "    PARS after fun shift:  $0 $1 $2 $3 $4 $5"
7  }
8
9  var=MAIN_VAR
10 echo ' '
11 echo "BEFORE FUN MAIN, VAR=$var"
12 echo "    PARS starting in main:  $0 $1 $2 $3 $4 $5"
13
14 test_fun1 "$@"
15 echo "    PARS after fun in main: $0 $1 $2 $3 $4 $5"
16 echo "AFTER FUN MAIN, VAR=$var"
17
18 exit 0
```

Sometimes you will see an (older) method of declaring functions, which explicitly includes a **function** keyword, as in:

```
1  function fun_foobar(){
2      statements
3  }
```

or

```
1  function fun_foobar{
2      statements
3  }
```
