Use Memory Checker Tools

Now that you are starting to use pointers, it is crucial to use memory checker tools, such as **valgrind** and/or the compiler option **-fsanitize=address**. These will help you find erroneous behavior, and make fixing your program easier. Use them all throughout the testing process.

For more information about valgrind and its memcheck tool, see the introduction in Course 2 of this specialization: https://www.coursera.org/learn/writing-running-fixing-code/supplement/Zq2y5/valgrind
